

This problem set will have you begin working on putting together your final project materials.

As with the previous problem sets, you will submit this problem set by pushing the document to *your* (private) fork of the class repository. You will put this and all other problem sets in the path /DScourseS23/ProblemSets/PS11/ and name the file PS11_LastName.*. Your OSCER home directory and GitHub repository should be perfectly in sync, such that I should be able to find these materials by looking in either place. Your directory should contain at least three files:

- PS11_LastName.bib
 - PS11_LastName.tex
 - PS11_LastName.pdf
1. Type `git pull origin master` from your OSCER DScourseS23 folder to make sure your OSCER folder is synchronized with your GitHub repository.
 2. Synchronize your fork with the class repository by doing a `git fetch upstream` and then merging the resulting branch. (`git merge upstream/master -m "commit message"` followed by `git push origin master`)
 3. Begin compiling a BibTeXfile (.bib extension) that will house the references for your final project writuep.
 4. Turn in a rough draft of your final project submission. You should turn in the L^AT_EXfile as well as the corresponding PDF output. I'd like to see all sections of the final project attempted; however you do not have to have polished prose. (e.g. bullet lists and other summaries are acceptable)
 5. Compile your .tex file, download the PDF and .tex file, and transfer it to your cloned repository on OSCER using your SFTP client of choice (or via scp from your laptop terminal). You may also copy and paste your .tex file from your browser directly into your terminal via nano if you prefer, but you will need to use SFTP or scp to transer the PDF.¹
 6. You should turn in the following files: .tex, .pdf, and any additional scripts (e.g. .R, .py, or .jl) required to reproduce your work. Make sure that these files each have the correct naming convention (see top of this problem set for directions) and are located in the correct directory (i.e. ~/DScourseS23/ProblemSets/PS11).

¹If you want to try out something different, you can compile your .tex file on OSCER by typing `pdflatex myfile.tex` at the command prompt of the appropriate directory. This will create the PDF directly on OSCER, removing the requirement to use SFTP or scp to move the file over.

7. Synchronize your local git repository (in your OSCER home directory) with your GitHub fork by using the commands in Problem Set 2 (i.e. `git add`, `git commit -m "message"`, and `git push origin master`). More simply, you may also just go to your fork on GitHub and click the button that says “Fetch upstream.” Then make sure to pull any changes to your local copy of the fork. Once you have done this, issue a `git pull` from the location of your other local git repository (e.g. on your personal computer). Verify that the PS11 files appear in the appropriate place in your other local repository.
